Risk profile

Fund facts

Fund objective

To provide investors with capital growth over the long-term by investing in a diversified portfolio of global equity securities.

Investor profile

Investors seeking long-term capital growth from global equity securities. The recommended investment horizon is 7 years or longer. Although the Fund's investment universe is global, units are priced in rands. Investors can therefore invest without having to personally expatriate rands.

Investment mandate

The Fund is a feeder fund and, other than assets in liquid form and currency contracts, invests only in one underlying fund – the M&G Global Equity Fund.

Quantitative analysis of individual companies, proprietary data analysis and machine learning are used to identify securities for potential inclusion by the fund managers. The Fund has exposure to a diversified portfolio that may include common stocks and shares, depository receipts, REITs, other collective investment schemes and financial derivative instruments.

30 June 2024	0.00 cpu 0.00%	0.00 cpu 0.00%

In March, US President Donald Trump postponed the implementation of 25% tariffs he had imposed on Canada and Mexico after markets tumbled on fears of their effect on inflation. US consumer spending, which makes up two thirds of the US economy, fell by 0.2% in January after a 0.8% increase in December, raising fears that consumers are cutting back on spending due to political uncertainty. US CPI declined to 2.8% y/y in February from 3.0% y/y in January; however, some market observers believe this level is temporary as long-term inflation expectations jumped to a 32-year high. The UK saw Labour Chancellor Rachel Reeves deliver her Spring Statement, announcing a £4.8 billion cut in welfare spending, as well as a crackdown on tax avoidance and trimmed the growth forecast to 1% in 2025. UK CPI eased to 2.8% y/y in February, down from 3.0% y/y in January. European markets experienced volatility due to tariff concerns and trade tensions, but hopes for a European-led peace initiative concerning Ukraine lifted sentiment and helped the FTSE100 reach a record high. Political stability following Germany's elections also boosted markets. The ECB cut interest rates by a quarter of a percentage point to 2.5%, leaving the door open to more cuts. The central bank cut its economic growth forecast for the eurozone to 0.9% for 2025.

In China, the People's Bank of China (PBOC) maintained its key lending rates, keeping the one-year Loan Prime Rate (LPR) at 3.1% and the five-year LPR at 3.6%. All enthusiasm boosted Chinese tech stocks, but tariffthreats dragged on performance. In Japan, the announcement of a 25% tariff by the US on auto imports sparked major concerns due to the country's large auto export sector. Trade tensions and tariffs continued to contribute to market volatility. In addition, public dissatisfaction with fiscal policies erupted in protest action against the Ministry of Finance. Looking at global equity market returns in March (in US\$), emerging markets outperformed developed markets, with the MSCI Emerging Markets Index returning 0.6% and the MSCI World Index delivering -4.4%. Among developed markets, the S&P 500 returned -5.6%, while the Dow Jones Industrial Average delivered -4.1% and the technology-heavy Nasdaq Composite posted -8.1% (in US\$). The UK's FTSE 100 returned 0.4% and Japan's Nikkei 225 delivered -2.6% (in US\$). The rand strengthened 0.5% against the US dollar, but weakened 3.2% against the euro and 1.9% against the pound sterling.

From a statistical perspective, we often consider the decomposed sources of risk in global equity markets - partitioning into systemic return drivers (for example, industry, country and style) and idiosyncratic return drivers. Throughout March, systemic risks dominated much of the cross sectional volatility globally. This outcome is intuitive given the prevailing market conditions; however, we are confident that these influences will revert to more typical levels, thereby allowing non systematic price drivers to emerge more prominently. Factor performance was largely uniform across regions in March, in contrast to the pronounced regional differences observed during much of 2024. Investor apprehension was manifest in a second risk-off month, with low-risk stocks - measured by volatility and beta - rallying robustly as market participants appeared to seek a 'flight to quality'. Our exposure to value measures contributed favourably, reflecting a rotation away from a growth focus towards higher-quality, more attractively priced opportunities. At the sector level, our overweight position in Financials proved to be a drag, while our underweight in Industrials was beneficial. Security selection in South Korea was strong, and our 4.7% underweight in the US provided some defence; however, stock selection and sectoral composition in US names proved challenging. Rand strength against the US dollar tempered performance slightly in March.

Glossary	
12-month yield	A measure of the Fund's income distributions as a percentage of the Fund's net asset value (NAV). This is calculated by summing the income distributions over a rolling 12-month period, then dividing by the sum of the NAV at the end of the period and any capital gains distributed over the same period.
Annualised performance	The average amount of money (total return) earned by an investment each year over a given time period. For periods longer than one year, total returns are expressed as compounded average returns on a yearly basis.
Cumulative performance graph	This illustrates how an initial investment of R100 or N\$100 (for example) placed into the Fund would change over time, taking ongoing fees into account, with all distributions reinvested.
Income distribution	The dividend income and/or interest income that is generated by the underlying Fund investments and that is periodically declared and distributed to investors in the Fund after all annual service fees.
Information ratio	Measures the Fund's active return (Fund return in excess of the benchmark) divided by the amount of risk that the manager takes relative to the benchmark. The higher the information ratio, the higher the active return of the Fund, given the amount of risk taken and the more consistent the manager. This is calculated over a 3-year period.
Maximum drawdown	The largest drop in the Fund's cumulative total return from peak to trough over any period.
Monthly volatility (annualised)	Also known as standard deviation. This measures the amount of variation or difference in the monthly returns on an investment. The larger the annualised monthly volatility, the more the monthly returns are likely to vary from the average monthly return (i.e. the more volatile the investment).
Percentage of positive rolling 12 months	The percentage of months, since inception, that the Fund has shown a positive return over a rolling 12-month period.
Sharpe ratio	The Sharpe ratio is used to measure how well the return of an asset compensates the investor for the risk taken. The higher the Sharpe ratio the better the Fund's historical risk-adjusted performance has been. This is calculated by taking the difference between the Fund's annualised return and the risk-free (cash) rate, divided by the standard deviation of the Fund's returns. This is calculated over a 3-year period.
Sortino ratio	This is calculated by taking the difference between the Fund's annualised return and the risk-free (cash) rate, divided by the downside deviation of the Fund's returns i.e. the "bad" volatility. A high Sortino ratio indicates a low risk of large losses occurring in the Fund. This is calculated over a 3-year period.
Total Expense Ratio (TER)	This shows the charges, levies and fees relating to the management of the portfolio and is expressed as a percentage of the average net asset value of the portfolio, calculated for the year to the end of the most recent completed quarter. A higher TER does not necessarily imply a poor return, nor does a low TER imply a good return. The current TER cannot be regarded as an indication of future TERs.
Transaction Costs (TC)	The percentage of the value of the Fund incurred as costs relating to the buying and selling of the Fund's underlying assets. Transaction costs are a necessary cost in administering the Fund and impacts Fund returns. It should not be considered in isolation as returns may be impacted by many other factors over time including market returns, the type of Fund, investment decisions of the investment manager and the TER.
Total Investment Charges (TIC)	The percentage of the value of the Fund incurred as costs, relating to the investment of the Fund. As fund returns are reported after deducting all fees and expenses, these costs (the TER, TC & TIC) should not be deducted from the fund returns.
Unit Classes	M&G's funds are offered in different unit classes to allow different types of investors (individuals and institutions) to invest in the same fund. Different investment minimums and fees apply to different unit classes. A Class: for individuals only. B & D Class: retirement funds and other large institutional investors only. X Class: the special fee class that was made available to investors that were invested in the Dividend Income Feeder Fund. T Class: for investors in tax-free unit trusts. F Class: for Discretionary Fund Managers.

If the income earned in the form of dividends and interest exceeds the total expenses, the Fund will make a distribution (cpu = cents per unit)

Disclaimer

MandG Investments Unit Trusts (South Africa) (RF) Ltd (Registration number: 1999/0524/06) is an approved CISCA management company (#29). Assets are managed by MandG Investment Managers (Pty) Ltd, which is an approved discretionary Financial Services Provider (#45199). The Trustee's/Custodian details are: Standard Bank of South Africa limited - Trustees Services & investor Services. 20th Floor, Main Tower, Standard Bank Centre, Heerengracht, Cape Town.

Collective Investment Schemes (unit trusts) are generally medium-to long-term investments. Past performance is not necessarily a guide to future investment performance. Unit trust prices are calculated on a net asset value basis. This means the price is the total net market value of all assets of the unit trust fund divided by the total number of units of the fund. Any market movements – for example in share prices, bond prices, money market prices or currency fluctuations – relevant to the underlying assets of the fund may cause the value of the underlying assets to go up or down. As a result, the price of your units may go up or down. Unit trusts are traded at the ruling forward price of the day, meaning that transactions are processed during the day before you or the Manager know what the price at the end of the day will be. The price and therefore the number of units involved in the transaction are only known on the following day. The unit trust fund may borrow up to 10% of the fund value, and it may also lend any scrip (proof of ownership of an investment instrument) that it holds to earn additional income. A M&G unit trust fund may consist of different fund classes that are subject to different fees and charges. Where applicable, the Manager will pay your financial adviser an agreed standard ongoing adviser fees, which is included in the overall costs of the fund. A unit trust summary with all fees and maximum initial and ongoing adviser fees, which is included in the overall costs of the fund. As a result, the fund may hace material risks. The volatility of the hund may be higher and the liquidity of the underlying securities may be restricted due to relative market sizes and market conditions. The fund's ability to settle securities and to repatriate investment income, capital or the proceeds of sales of securities may be adversely affected for multiple reasons including market conditions, macro-economic and political circumstances. Purchase and repurchase as to the capital investment to the fund or the
